

# What is GIS?

GIS (Geographic Information System) is a system of computer software, hardware, data and personnel working together to manipulate, analyze, and present information that is tied to a geographic location.

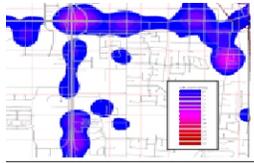

GIS provides more intelligent maps that are based on geographic data that has one or more associated databases.

Map with EMS calls as points

Tabular data associated with the points

Table taken from a database such as firehouse with EMS call information

Map with calls as points and density

Difficult to interpret

Easy to interpret

# Why Use GIS?

## Improve Organizational Integration

One of the main benefits of GIS is improved management of your organization and resources. A GIS can link data sets together by common-location data, such as addresses, which helps departments share their data. By creating a shared database, one department can benefit from the work of another, with data being collected once and used many times.

## Make Better Decisions

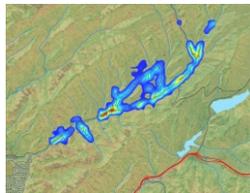

Fire station coverage area for response analysis

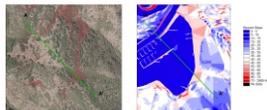

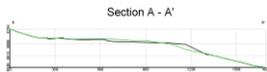

The old adage 'better information leads to better decisions' is true for GIS. A GIS is not just an automated decision-mapping system but a tool to query, analyze, and map data in support of the decision-making process.

## Make Maps

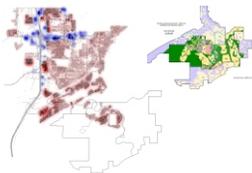

For simplicity's sake, we often call GIS 'Mapping Software'. We most often associate maps with physical geography, but GIS is flexible enough to map any kind of data you wish.

Mapping of population density, slope and vegetation

Mapping of impacts from potential new development

Mapping of commercial and residential population density and modeling potential build-out scenarios for Impact Fee calculations

# Geo-Myths

## GeoMyth 1: GIS is just good for making maps

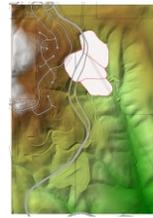

GIS is not just about making maps; it's about providing a platform for accessing information - and more information means better decision-making.

Realistic 3-D modeling of potential new development impacts for Planning Commission

Mobile GIS for Police, EMS, Code Enforcement and Public Works

Geologic Hazards Identification

## GeoMyth 2: Our city is too small to benefit from GIS

Many cities have experienced unprecedented growth in recent years and the trend is to increase in the future. GIS can be an invaluable tool in managing this growth.

Every city needs some level of mapping support to operate efficiently, but the beauty of GIS is that it can be tailored to fit the need of any city, large or small.

- ⊗ Community Development
- ⊗ Tax Base Balance
- ⊗ GASB 34
- ⊗ Crime
- ⊗ Suburban Sprawl
- ⊗ Economic Development
- ⊗ Open Space
- ⊗ Traffic

## GeoMyth 3: We need a staff person to operate the GIS, and it's too expensive

- ⊗ You don't need someone in-house to 'do' GIS if the initial system is well-planned. GIS should be a tool that everyone can use to access information and be more productive in their jobs.
- ⊗ Your staff shouldn't have to be concerned with building and maintaining the data.
- ⊗ It costs money to implement a GIS, but when compared with the costs of not having a GIS is quickly becomes apparent the GIS can pay for itself as a result of the increased efficiencies it produces.

# GeoCity

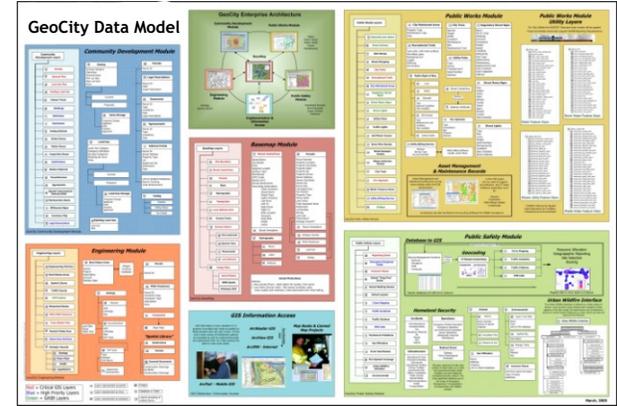

## What is the GeoCity Model?

GeoCity represents an innovative approach to GIS design services - no other service provider offers this.

It is a results-oriented and proactive approach to maximizing the benefits of GIS.

The model represents extensive research and knowledge into City GIS and provides a template for GIS needs that apply to any city!

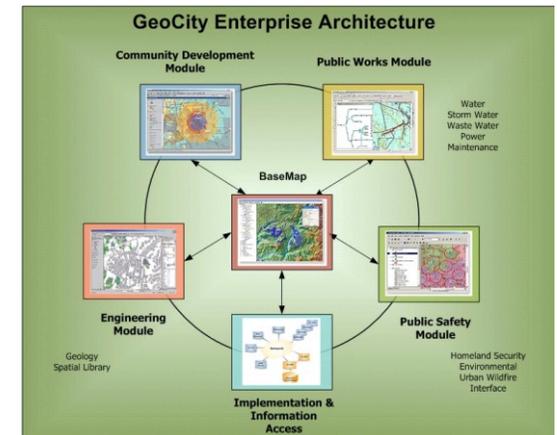

## So how does it work?

Having this model means that the time spent on user needs assessment is greatly reduced, which also means:

- ⊗ Our GIS will cost you less
- ⊗ Our GIS will be implemented quicker
- ⊗ So instead of us spending time and money trying to determine what you need, we are saying that we already know what you need and how to do it, now you tell us what you want!

The GeoCity model is also unique in that it breaks the GIS into logical groupings (modules) based on City Department

## About Us

Pete Shabestari has been helping clients increase efficiency and save money through the use of GIS and the GeoCity model since 1995. Based in Sandy, Utah, clients include local municipalities and mining industry firms. Our unique background, training and skill set will allow you to implement your own GIS solution with unprecedented precision and savings. Call today for your free evaluation.
